Software Methods and Tools
Spring 2017

Assignment 2
Due on 11:59PM, Monday, February 6, 2017

Description:
We will use IBM Rational Software Modeler to create a UML class diagram in this assignment. Imagine that you are asked to design and implement a Snake video game. If you are not familiar with the Snake game, try to play it at https://playsnake.org/ to get a general idea about how it works. In fact, this is the application that we will be focused on in our remaining assignments. We will design, implement (or adapt), and test the application with different software methods and tools, and finally use a version control system to manage its source code later this semester.

Our task in Assignment 2 is creating a UML class diagram that captures the main classes and their relationships of the Snake game. Below is a list of classes that must be included in your diagram. Note that this is not a complete list, and some important class(es) may be missing. You need to figure it out and make a class diagram that includes all the essential classes.

- **GameBoard.** This class represents the game board (i.e. GUI) where you play the game.

- **Clock.** The Clock class manages the information such as the number of cycles that have elapsed, the number of milliseconds per cycle, etc.
• *GameControl*. It decides when the game is over and whether the player wins or not. It may also control how the player plays the game (e.g. keys used). Again, this depends on your specific design.

Complete your design, and add all the necessary attributes and operations (include constructors) for each class. For attributes, you must include visibility, name, and type. For operations, you must include visibility, name, parameter list, and return type.

Make sure that your diagram shows the complete signature of attributes and methods. Include generalizations, aggregations, compositions, realizations, associations, and multiplicities where they apply.

Your final submission should include (1) a screenshot of your class diagram, and (2) descriptions of each class in your diagram. Convert it to a PDF document, and submit it to Blackboard.
